Teploobmen i gidrodinamika (Heat Transfer and Hydrodynamics) Kiev, 1958. 190 p. (Series: Itsi Stornik trudov, no. 14) 2,030 copies printed.

Eds. of Publishing House: Ye.L. Kaplan and M.M. Labinova; Tech. Sci.: M.I. Yefimova; Editorial Board: I.T. Sveta (Ed.), Academician, Academy of Sciences URSR; G.M. Shcherbakov (Ed.), Candidate of Technical Sciences; N.M. Korzak (Ed.), Corresponding Member, Academy of Sciences URSR; V.I. Tolubinskiy, Doctor of Technical Sciences; M.M. Nazarchuk, Candidate of Technical Sciences; P.D. Svetov, Professor; and N.M. Pyatishin, Candidate of Technical Sciences.

PURPOSE: This collection of articles is intended for scientific workers and technical personnel in the fields of heat transfer and hydrodynamics.

COVERAGE: This collection of 18 articles deals with experimental and theoretical studies of problems in heat transfer and hydrodynamics as they affect steam and gas turbines and heat transfer in turbine components and in elements of heat-utilizing apparatus are described. The calculation methods are suggested. Several problems of the thermodynamics and aerodynamics of steam and gas turbines are discussed. References follow each article.

Belitskiy, S.A. Investigation of the Amount of Heat Given off when Steam Solutions of Lithium Bromide and Lithium Chloride are Boiled Under Vacuum. The paper deals with a study of the heat-transfer coefficient for boiling solutions of LiBr and LiCl under conditions of solution, the ambient pressure, and other parameters are determined.

Politskiy, M.I. Approximate Method of Calculating Velocity and Temperature Fields for the Case of Laminar Flow of a Compressible Fluid with Heat-Transfer Around an Object. On the Possibility of Reducing the Differential Equations of a Laminar Boundary Layer to Ordinary Differential Equations.

Shkretz, P.D., and V.I. Pechuk. Aerodynamic Investigations of the System of Interdiffuser Exchange of Steam in Powerful Steam Turbines. The authors present the results of model tests to study interdiffuser exchange in steam turbines. The study is primarily concerned with the hydraulic losses encountered. Recommendations for reducing the internal drag of the system are presented.

Gashchenko, I.L. Effect of Manufacturing Defects on End Losses in the Guide Vanes of Welded Turbine Impellers.

Gorbatyy, Yu.P., A.Sh. Dorfman, and M.I. Soykovskiy. Effect of Reversibility and Pitch on the Magnitude of the Profile Losses in Cascades.

Soykovskiy, M.I., and A.Sh. Dorfman. Criteria for Estimating the Efficiency of Intake Nozzles.

Yermachenko, A.S., and A.P. Pedosenko. Losses in Turbine Guide Vanes of the Cascade Type.

Yermachenko, A.S., and A.P. Pedosenko. Investigation of the Losses in Turbine Blade Cascades.

The above two papers deal with an investigation of the losses in turbine guide vanes of the cascade type. The efficiency of the cascade is determined as a function of the inflow angle, blade-incidence angle, blade pitch, and other parameters.

Sveta, I.T., V.M. Sidun, and L.I. Romanuk (Deceased). Experimental Investigation of the Heat Conductivity of Soils Used in Greenhouses and Hotbeds.

TOPIC TAGS: phosphate, nuclear decontamination, strontium, ytterbium

ABSTRACT: A report on a study of the decontaminating capacity of raw gypsum, commercial superphosphate and some Rumanian bentonites. The tests also considered the quantity of decontaminating agent, various proportions in mixtures of the substances, the presence of salts often found in surface waters, and the pH. Best results were obtained with raw gypsum, especially for fluoridated water; bentonites were found to be most effective as mixtures of two types. Orig. art. has: 5 figures. Title : Magnetic Manometer for Large Range of Pressures

Orig Pub : Studii si cercetari fiz., 1957, 7, No 1, 85-89

Abstract : Description of a magnetic manometer, whose operating principle is analogous to the Penning manometer, but having several advantages over the latter, namely an increased sensitivity (thanks to a considerable increase in the mean free path of the electrons), a larger range of measured pressures (10^{-4} to 10^{-8} mm mercury). The higher sensitivity of the manometer makes it possible to use it as a leak detector in vacuum apparatus.

The manometer is a diode having electrodes of special construction. The anode is a filament located along the axis of a cylindrical cathode. The space between the two is subdivided into several sections by means of disks (0.1 mm thick)

TITLE: Simple measuring circuit for an MT-6 thermoelectric manometer

SOURCE: Izmeritel'naya tekhnika, no. 12, 1965, 67

TOPIC TAGS: manometer, vacuummeter, vacuum measurement, gas pressure

ABSTRACT: The MT-6 thermoelectric manometer combined with a VSB-1 vacuummeter permits measuring air (or gas) pressure within 1--4000 newtons/m². The vacuummeters, however, have been in short supply, they are complicated and expensive. Hence, a simplified electronic circuit is suggested to replace the above vacuummeter. The two-electron-tube circuit includes an a-f oscillator and operates on a bridge-compensating principle (circuit diagram is shown). Three or more MT-6 bulbs can be connected to the new circuit via a change-over switch. A calibration curve for dry air and nitrogen is given. Orig. art. has: 2 figures.

AUTHOR: Birshert, G.G., Engineer

TITLE: Reducing the Contamination of Hydrogen by Air in TV-50-2 Turbogenerators

PERIODICAL: Energetik, 1959, Nr 11, pp 16-17 (USSR)

ABSTRACT: The author explains how air enters the interior of the hydrogen-cooled TV-50-2 turbogenerator of the "Elektrosila" plant. Since the generators of this type work with an excess of hydrogen pressure, air cannot enter the stator through leaks. It was found that the oil fed to the gaskets is the only source of the air contamination. The oil coming from bearing Nr 4 carries a considerable amount of air and is fed to the vacuum cleaning tank. However, not all of the air is removed in the vacuum tank. The oil then enters the heated gaskets and the remaining air will escape. To eliminate the air content of the oil, the author suggests feeding the vacuum tank from the main oil tank of the turbogenerator instead of using the oil from bearing Nr 4. The direct

Card 1/2

SOV/91-59-11-10/27

Reducing the Contamination of Hydrogen by Air in TV-50-2 Turbogener-
ators

pipeline connection was blocked by a valve. The oil from bearing Nr 4 will enter in this case the main oil tank before going to the vacuum tank. The air contamination of the hydrogen in the turbogenerator was reduced considerably. Previously, purging of the hydrogen had to be performed within four or five days, whereby about 20-30 cu m of hydrogen were consumed. There are 2 diagrams.

PERIODICAL: Izvestiya Akademii Nauk SSSR, Seriya Fizicheskaya, 1958, Vol. 22, Nr 3, pp. 324 - 324 (USSR)

ABSTRACT: 1) A theory of the dipole-moments of the polymer-molecules was proposed which connects the mean square of the dipole-moment of the polymeric chain with its chemical structure, with the stereoisomerism and with the retarding of inner rotation. The theory refers to the polymers of the type $(-CR_2-)_n$

Card 1/4

$(-CH_2-CR_2-)_n$, $(-CH_2-CHR-)_n$ and $(-CHR-)_n$, where R is a polar
 pendant (privesok). Besides the first approximation of the
 theory which takes only account of the interaction between the
 nearest chain-series, also a second approximation was obtained
 which takes account also of more far distanced series. 2) It
 was shown that the dipole-moment can largely depend on the
 stereoisomerism of the chain: with chains of the type $(-CH_2-CHR-)_n$

and especially $(-CHR-)_n$ the dipole-moment is substantially
 smaller with the dl- than with the dd- position of the polar
 groups (under equal conditions of inner rotation in the chain).
 It was also shown that in chains of the type $(-CH_2-CHR-)_n$ with
 closely connected dipoles the dipole-moment depends on the
 circumstance which pendants - polar or non-polar - mutually

Report Thesis. For Details Consult T. M. Birshteyn, O. B. Ptitsyn, ZhTF, 24, 1998 (1954) O. B. Ptitsyn, Yu. A. Sharonov, ZhTF, 27, 2744, (1957)

repel more intensely. When an inner rotation takes place in polar pendants, then the dipole moment does not depend on the structure in the first approximation. 3) A comparison of the theory with the experimentally found values according to poly-p-halogen styrenes and polychlorovinyl show that in the chains of these polymers the phenyl series or the chlorine atoms repel mutually more intensely than the hydrogen atoms. The degree of retardation of rotation in these polymers which was determined according to dipole moments in accordance with experimentally obtained data corresponds approximately to the values determined from the size of the molecules and from the photoelastic moment.

PERIODICAL: Zhurnal Tekhnicheskoy Fiziki, 1958, Vol. 28, Nr 4, pp. 813-826 (USSR)

ABSTRACT: It is shown here that in the case of tetrahedral valence-angles the polyisobutylene-molecules on the average are optically isotropic, independent of the nature of internal rotation. In a rotary-isomeric approximation the author here performs the calculation of the average optical anisotropy of the polyisobutylene molecules in the case of a complete correlation of the internal rotations within the monomer and of the independent internal rotations of the monomers. The obtained value for the average optical aniso-

AUTHORS: 51. Borisova, N. P.; Birshteyn, T. M.

TITLE: Conformations of isotactic polymers

PERIODICAL: Vysokomolekulyarnyye soyedineniya, v. 5, no. 2, 1963, 279-286

TEXT: A quantitative evaluation was made of the interactions in crystalline and in dissolved isotactic polypropylene, in poly-4-methylpentene-1, poly-3-methyl-butene-1, and in polyacetaldehyde, in order to determine the role of torsional vibrations and rotation isomerism in the statistical coiling of the chain. For crystalline polypropylene, the energy of the monomer links was calculated with a change of the angle of internal rotation between $-30^\circ < \psi_1 < 20^\circ$, $80^\circ < \psi_2 < 140^\circ$ (Fig. 1). The rotation of the branch about the $C_2 - R_1$ bond was likewise considered. For each conformation, the rotation angle ψ_1 was sought that corresponded to a minimum of the total energy of the system. This was calculated from
$$U(\psi_1, \psi_2, \psi_1) = 1.5 (3 - \cos 3\psi_1 - \cos 3\psi_2 - \cos 3\psi_1) + \sum_{i,k} U_{i,k}(x_{i,k}),$$

Conformations of isotactic ...

where the first member describes the orientation effect of the bonds and the second member the steric interactions of the atoms. The data of L. Bartell (J. Chem. Phys., 52, 827, 1960) and T. Hill (J. Chem. Phys., 16, 399, 938, 1948) were considered for the interactions of non-bound C---C and H---H atoms. The calculation yielded a potential well with flat bottom and an energy of 2.5 kcal/mole with tetrahedral valency angles and of 1.6 kcal/mole with 114° valency angles. Thus the links are able to vibrate in a 20° interval of the angles ψ_1 and ψ_2 . The transition from

one conformation to the other is easy. In statistically coiled chains, the conformations $(0^\circ, 120^\circ)(0^\circ, 120^\circ)$, $(-120^\circ, 0^\circ)(-120^\circ, 0^\circ)$ and $(-120^\circ, 0^\circ)(0^\circ, 120^\circ)$ are possible; whereas the conformation $(0^\circ, 120^\circ)(-120^\circ, 0^\circ)$ is sterically unfavorable owing to the H_2 --- H_6 and

H_{R_1} --- H_{R_3} interaction. In solution, the polypropylene molecules form

right and left-handed helices somewhat distorted by twisting vibrations and containing ~15 monomeric units. The mean energy of the junction between the helices is 1.5 kcal/mole. For the monomer link of polyacetaldehyde $H(-CHCH_3-O)_nH$ the energy was calculated for different

AUTHORS: Birshiteyn, T. M.; Ptitsy*n, O. B.

TITLE: Stereospecific effect of growing chain end upon polymerization of charged monomers

SOURCE: Vy*sokomolekulyarny*ye soyedineniya, v. 6, no. 2, 1964, 224-226

TOPIC TAGS: syndiotactic addition, monomeric unit, stereospecific effect, isotactic addition

ABSTRACT: The probability of iso- and syndiotactic additions of a charged monomeric unit to the end of a charged chain of the type $(-CH_2-CHR-)_n$ has been calculated on the basis of the hypothesis of Fox, Good, and Fordham which states that the probability of iso- and syndiotactic addition of the monomeric unit to the end of a growing chain is determined by the free energies of the resultant chain on corresponding addition of the last monomeric unit. The calculations were performed using previously made evaluations of the interaction energies of adjacent and near adjacent charged groups in chains of the type $(-CH_2-CHR-)_n$. The results show that the isotactic addition is energetically more advantageous so that polymerization of dissociated electrolytes (e.g., alkali acrylates) should lead to considerable shift

Ed. of Publishing House: P.M. Belyanin; Tech. Ed.: T.P. Polonova.

PURPOSE: This book is intended for specialists in the field of machine and instrument manufacture who use radioactive isotopes in the study of materials and processes.

COVERAGE: This collection of papers covers a very wide field of the utilization of tracer methods in industrial research and control techniques. The topic of this volume is the use of radioisotopes in the machine- and instrument-manufacturing industry. The individual papers discuss the applications of radioisotope techniques in the study of metals and alloys, problems of friction and lubrication, metal cutting, engine performance, and defects in metals. Several papers are devoted to the use of radioisotopes in the automation of industrial processes, recording and measuring devices, quality control, flowmeters, level gauges, safety devices, radiation counters, etc. These papers represent contributions of various Soviet institutes and laboratories. They were published as Transactions of the All-Union Conference on the Use of Radioactive and Stable Isotopes and Radiation in the National Economy and Science, April 4-12, 1957. No personalitis are mentioned. References are given at the end of most of the papers.
